

The lines 2 and 5 throw an error.

2 throws an error because you cannot assign values to literals, but only variables, in this case you cannot assign a value to the integer 5

5 throws an error because the variable b is not defined.

If you execute them in a python script the variable assignments don't make sense anymore, since the variables are lost afterwards? If the rest makes sense depends on the context but for me it does not since it are just random assignments of variables without purpose.
